

# Birds of Latvia

## Checklist with remarks about species occurrence

All species known to have occurred in Latvia are listed in systematic order (based on Voous sequence) following guidelines of Association of European Rarities Committees. The key to each abbreviated status is as follows. Small letters rather than capitals signify a scarcer distribution - less than 10 records for Latvia until 16.08.2010.

The avifauna of Latvia includes a total of 344 species. Place for subspecies or new entries you will find at the end of this list.

**CB** - casual breeder  
**MB** - migrant breeder  
**PM** - passage migrant  
**RB** - resident breeder  
**WV** - winter visitor  
**SV** - summer visitor  
**V** - vagrant  
**E** - escaped or recently introduced

*Name, route, dates etc.*

## Categories used for the national list:

**Category A** - species which has been recorded in an apparently wild state at least once since 1.1.1950 [Majority of the species - are not marked in the categories' column].

**Category B** - species which has been recorded in an apparently wild state only between 1800 and 1949

**Category C** - released or escaped species which has established a self-supporting breeding population in the own country; also birds coming from a category C population of another country (with the species not breeding in the own country).

**Category D** - every species unless it is almost certainly a genuine vagrant (in which case it enters Cat. A), or almost certainly an escape from captivity (Cat. E). Here also these species, which has been found dead at the sea-shore and there is doubt about their death within Latvian territory or beyond.

**Category E** - escapes from captivity.
